

Backing Up Your Data – Appendix - A

SyncToy

Installing SyncToy – Microsoft Sync Framework 2.0

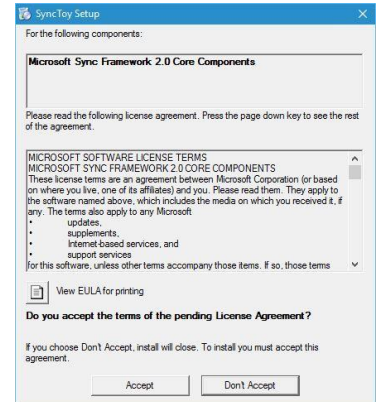

Execute or run the file you downloaded. It does not take very long to install.

First thing you will notice is the **Microsoft Sync Framework 2.0 Core Components** agreement. Read it, and click the **Accept** button.

This is a small program from Microsoft that supplies part of the functionality that SyncToy requires to work. You may in fact have a later version of this already on your device, if so, you still need to install this version.

Wait for Framework components to complete installing.

If by some chance you already have Microsoft Sync Framework 2.0 Core Components already installed, you will not be asked to install it again and you should go straight to the following.

An issue raised in the presentation that the link provided when installing **SyncToy** to automatically install “**Microsoft Sync Framework 2.0 Core Components**” (for those who did not already have it) could not find the requested page at Microsoft. As stated in the presentation these organisations move items to different pages at various times.

The following will guide you to the correct location:

In your Browser’s search engine, search for “**microsoft sync framework 2.0 core components**” and you should see the appropriate link, as shown opposite.

Select the link:

[Download Microsoft Sync Framework 2.1 Redistributable ...](#)

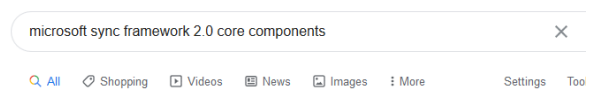

This will take you to the correct location with Microsoft where you can select the **Download** option.

Make sure you install it onto your computer before you try to run SyncToy.

Regards

Gary Fitzgerald
